Day 16: [Scripting] Help! Where is Santa?

Solution/Walkthrough:

Tools: kali, nmap, python

Q1: What is the port number for the web server?

Answer: 80

1. Open the terminal using nmap -v(which give a more verbose output) and will find the port under http

```
root@ip-10-10-184-232:~# nmap -v 10.10.235.27

Starting Nmap 7.60 ( https://nmap.org ) at 2022-07-17 12:16 BST
Initiating ARP Ping Scan at 12:16
Scanning 10.10.235.27 [1 port]
Completed ARP Ping Scan at 12:16, 0.22s elapsed (1 total hosts)
Initiating Parallel DNS resolution of 1 host. at 12:16
Completed Parallel DNS resolution of 1 host. at 12:16, 0.00s elapsed
Initiating SYN Stealth Scan at 12:16
Scanning ip-10-10-235-27.eu-west-1.compute.internal (10.10.235.27) [1000 ports]
Discovered open port 22/tcp on 10.10.235.27
Discovered open port 80/tcp on 10.10.235.27
Completed SYN Stealth Scan at 12:16, 1.45s elapsed (1000 total ports)
Nmap scan report for ip-10-10-235-27.eu-west-1.compute.internal (10.10.235.27)
Host is up (0.014s latency).
Not shown: 998 closed ports
PORT      STATE SERVICE
22/tcp    open  ssh
80/tcp    open  http
```

Q2: Without using enumerations tools such as Dirbuster, what is the directory for the API? (without the API key)

Answer: /api/

1. Open the web browser and input the ip of the machine following with the port number

10.10.235.27:80

2. This will now bring you to website, then view the page source

- [Home](#)
- [Examples](#)

[View Source](#), [Template not my own](#).

Santa's Tracking System

Are you an Elf that [Santa](#) has forgotten? Use this system to track [Santa](#)! Note: due to how many [humans](#) try to find where Santa is, the link is hidden on this webpage. You're going to have to manually [click](#) every single link. Or perhaps there is a way to find all the links as fast as a [Python](#)?

Important [notice](#) All deliveries to [Skidy](#) for [TryHackMe](#) jumpers are to be stopped. That [man](#) has asked for [613](#) on the premise that they are the softest [jumper](#) in the world. Please, we need to share them out.

53            </h1>
54            <h2 class="subtitle">

```

- Under category you will find a list with all the href attribute showing “#” except for one, called “Modular modern free”

`Modular modern free`

Q3: Where is Santa right now?

Answer: Winter Wonderland, Hyde Park, London

- Using python write and run a code using the range function.

```
url = 'http://10.10.49.56:8000/api/'
```

- Since we know the api number is somewhere within 0 to 100 and is an odd number we can set our range function as such.

```

for i in range(1,100,2):
    r = requests.get(url+str(i))
    if 'Error' not in r.text:
        print(i)
        print(r.text)

```

3. Then we run the program using python3 which will not only out Santa's location but also the api number for the final question.

```

57
{"item_id":57,"q":"Winter Wonderland, Hyde Park, London."}

```

Q4: Find out the correct API key. Remember, this is an odd number between 0-100. After too many attempts, Santa's Sled will block you.

Answer: 57

Thought Process/Methodology:

The process in which was used to solve question number 1 was by using nmap to scan our network to display the port we are using. As for the second question, we need to use the information that we have about the port number with the webpage link given to visit the website. There, by viewing the page source we can find the hidden link. From there, using python(which we learned on day 15) we can write some code which can get both the api number and Santa's location.

Day 17: [Reverse Engineering] ReverseELFneering

Solution/Walkthrough:

1. We first want to SSH into our target machine with the username **elfmceager** and the password **adventofcyber**.

```
root@kali:~# ssh elfmceager@10.10.103.106
The authenticity of host '10.10.103.106 (10.10.103.106)' can't be established.
ECDSA key fingerprint is SHA256:XrBuXSQs0wRKhvVRdrSfE/0F5ccAZQiXAhMhzB1dV7U.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added '10.10.103.106' (ECDSA) to the list of known hosts.
elfmceager@10.10.103.106's password:
Welcome to Ubuntu 18.04.5 LTS (GNU/Linux 4.15.0-128-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:    https://landscape.canonical.com
 * Support:       https://ubuntu.com/advantage

System information as of Sat Dec 19 13:39:59 UTC 2020

System load:  0.01               Processes:    98
Usage of /:   40.6% of 11.75GB   Users logged in:  0
Memory usage: 17%               IP address for ens5: 10.10.103.106
Swap usage:  0%

0 packages can be updated.
0 updates are security updates.

Last login: Wed Dec 16 18:25:51 2020 from 192.168.190.1
elfmceager@tbfc-day-17:~$
```

2. Use **radare2** to enter debug mode so that we can learn more about our file. We can do this using **r2 -d ./challenge1**.

```
elfmceager@tbfc-day-17:~$ r2 -d ./challenge1
Process with PID 1516 started ...
= attach 1516 1516
bin.baddr 0x00400000
Using 0x400000
Warning: Cannot initialize dynamic strings
asm.bits 64
[0x00400a30]>
```

3. Once we are inside debugging mode, we can do a full analysis of the file using the **aa** command

```
[0x00400a30]> aa
[ WARNING : block size exceeding max block size at 0x006ba220
[+] Try changing it with e anal.bb.maxsize
WARNING : block size exceeding max block size at 0x006bc860
[+] Try changing it with e anal.bb.maxsize
[x] Analyze all flags starting with sym. and entry0 (aa)
[0x00400a30]>
```

- Most executable programs have an entry point named **main**. Let's first search for this. We can do this using the **afl** command and then filter our results with **grep**. The final command will be **afl | grep main**

```
[0x00400a30]> afl | grep main
0x00400b4d  1 35      sym.main
0x00400de0  10 1007 → 219 sym.__libc_start_main
0x00403840  39 661 → 629 sym._nl_find_domain
0x00403ae0  308 5366 → 5301 sym._nl_load_domain
0x00415ef0  1 43      sym._IO_switch_to_main_get_area
0x0044ce10  1 8       sym._dl_get_dl_main_map
0x00470430  1 49      sym._IO_switch_to_main_wget_area
0x0048f9f0  7 73 → 69 sym._nl_finddomain_subfreeres
0x0048fa40  16 247 → 237 sym._nl_unload_domain
[0x00400a30]>
```

- Let's take a closer look at it using the **print disassembly function(pdf)**. We can do this with the command **pdf @ main**.

```
[0x00400a30]> pdf @ main
;-- main:
(fcn) sym.main 35
sym.main ();
; var int local_ch @ rbp-0xc
; var int local_8h @ rbp-0x8
; var int local_4h @ rbp-0x4
; DATA XREF from 0x00400a4d (entry0)
0x00400b4d  55      push rbp
0x00400b4e  4889e5   mov rbp, rsp
0x00400b51  c745f4010000. mov dword [local_ch], 1
0x00400b58  c745f8060000. mov dword [local_8h], 6
0x00400b5f  8b45f4    mov eax, dword [local_ch]
0x00400b62  0faf45f8  imul eax, dword [local_8h]
0x00400b66  8945fc    mov dword [local_4h], eax
0x00400b69  b800000000 mov eax, 0
0x00400b6e  5d       pop rbp
0x00400b6f  c3       ret
[0x00400a30]>
```

- What we see here are the **Assembly** instructions for the main function!.

Q: What is the value of `local_ch` when its corresponding `movl` instruction is called (first if multiple)?

Answer: 1

- To put a breakpoint at this location we can use **db** and then pass in the address. Now when we can run **pdf @ main** again we should see the breakpoint set correctly.

```
[0x00400a30]> pdf @ main
;-- main:
(fcn) sym.main 35
sym.main ();
; var int local_ch @ rbp-0xc
; var int local_8h @ rbp-0x8
; var int local_4h @ rbp-0x4
; DATA XREF From 0x00400a4d (entry0)
0x00400b4d 55 push rbp
0x00400b4e 4889e5 mov rbp, rsp
0x00400b51 c745f4010000. mov dword [local_ch], 1
0x00400b58 c745f8060000. mov dword [local_8h], 6
0x00400b5f b 8b45f4 mov eax, dword [local_ch]
0x00400b62 0faf45f8 imul eax, dword [local_8h]
0x00400b66 8945fc mov dword [local_4h], eax
0x00400b69 b800000000 mov eax, 0
0x00400b6e 5d pop rbp
0x00400b6f c3 ret
[0x00400a30]>
```

2. Now use **dc** to run the program. We should receive a message that we have stopped at the breakpoint we set. Once we stop at this point, we can analyze the contents of **local_ch** with the command **px @ rbp-0xc**. We see the value is 1!

```
[0x00400b5f]> px @ rbp-0xc

Q2: What is the value of **eax** when the **imul** instruction is called?

Answer: 6

1. We can simply use **ds** to move to the following line and then use **dr** to see the value of **eax**. We see that the value is 6.

```

[0x00400b5f]> dr
rax = 0x00000006
rbx = 0x00400400
rcx = 0x0044b9a0
rdx = 0x7ffd6477e2b8
r8 = 0x00000000
r9 = 0x00000003
r10 = 0x00000002
r11 = 0x00000000
r12 = 0x004018e0
r13 = 0x00000000
r14 = 0x006b9018
r15 = 0x00000000
rsi = 0x7ffd6477e2a8
rdi = 0x00000001
rsp = 0x7ffd6477e180
rbp = 0x7ffd6477e180
rip = 0x00400b66

Day 18: [Reverse Engineering] The Bits of Christmas - Story

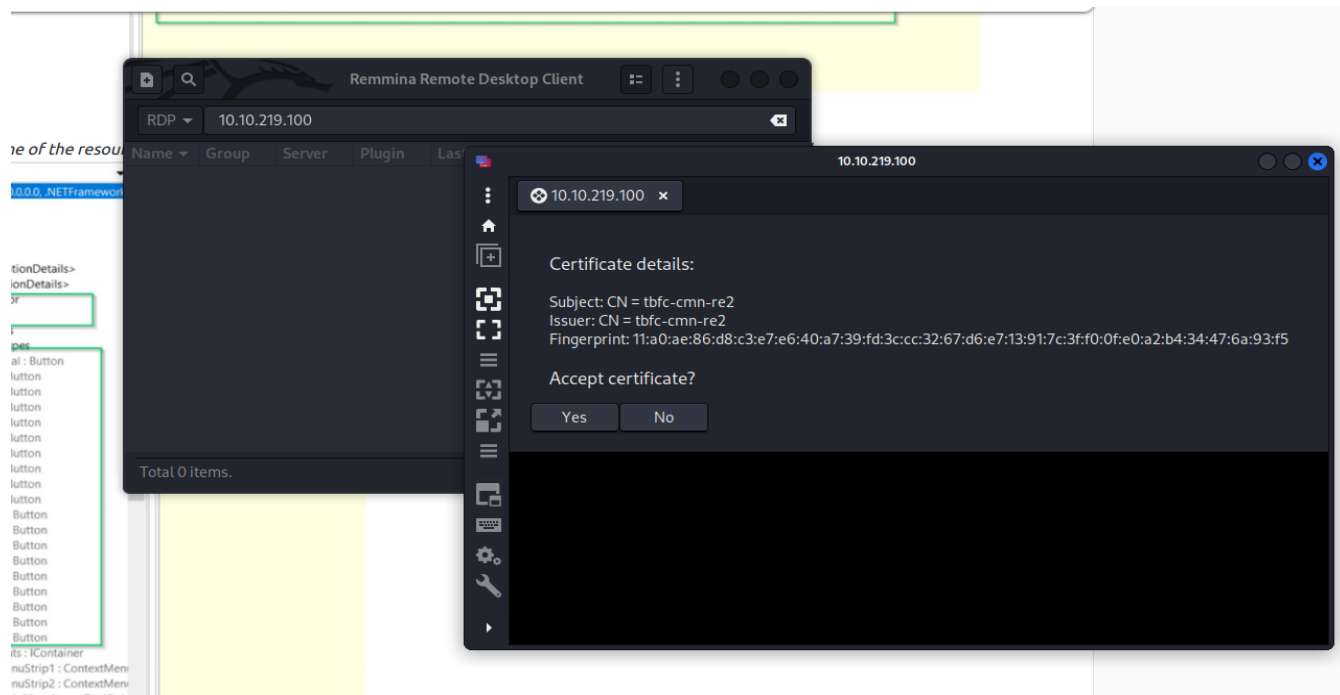

Tools: Linux, remmina, ILSpy, cyberchef

Solution/Walkthrough:

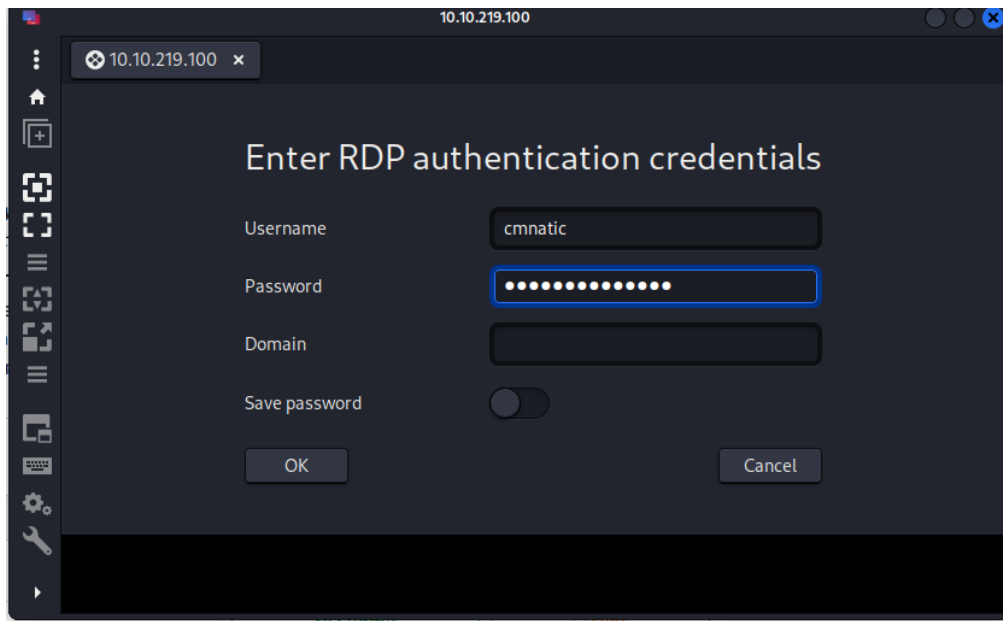

Q: Open the "TBFC_APP" application in ILSpy and begin decompiling the code

Answer: No answer needed

1. First we begin by installing the remmina and launching it.
2. Using the machine's ip address to log in with the Remote Desktop Protocol (RDP)

3. Enter the username and password that has been provided, then press OK.

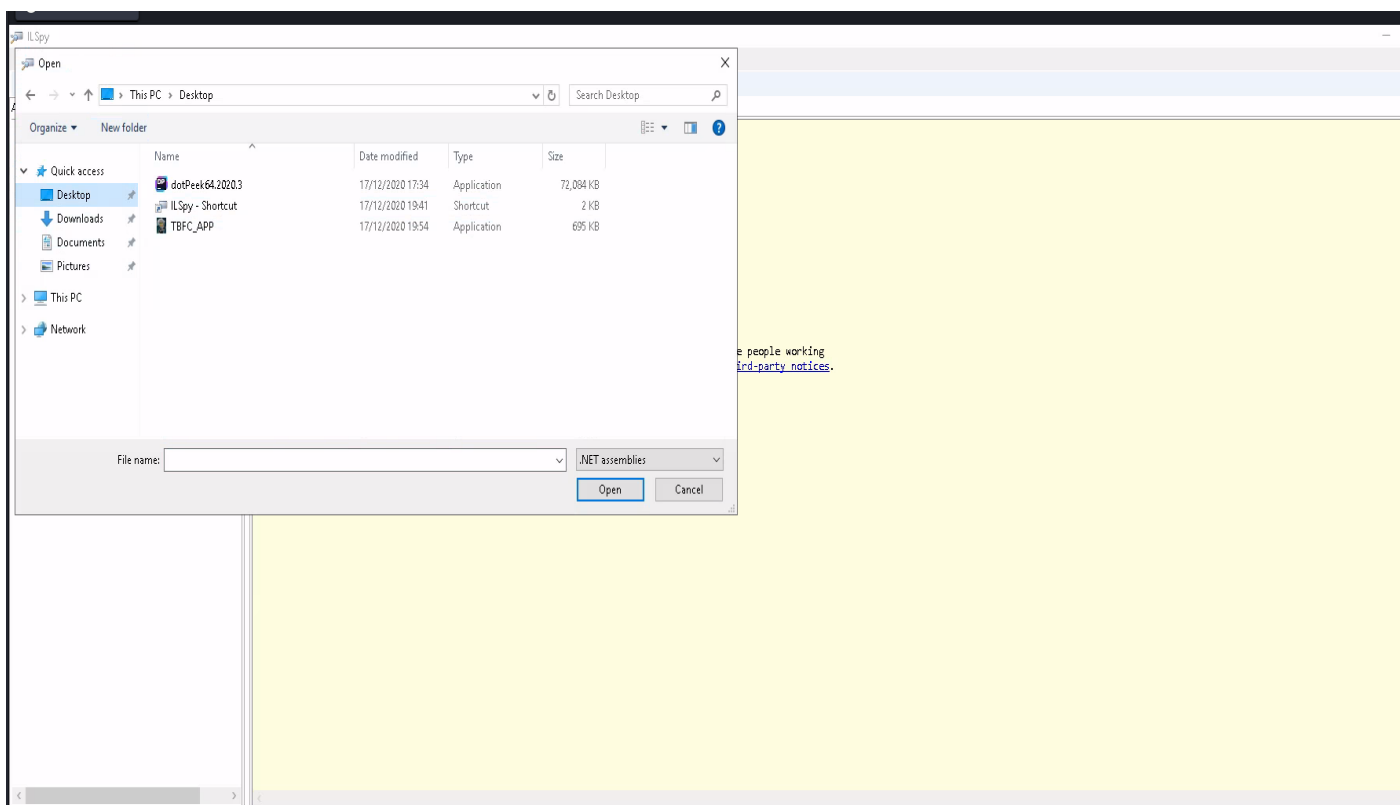

4. After login in, we look at the TBFC_APP and try entering a random password to check an output.

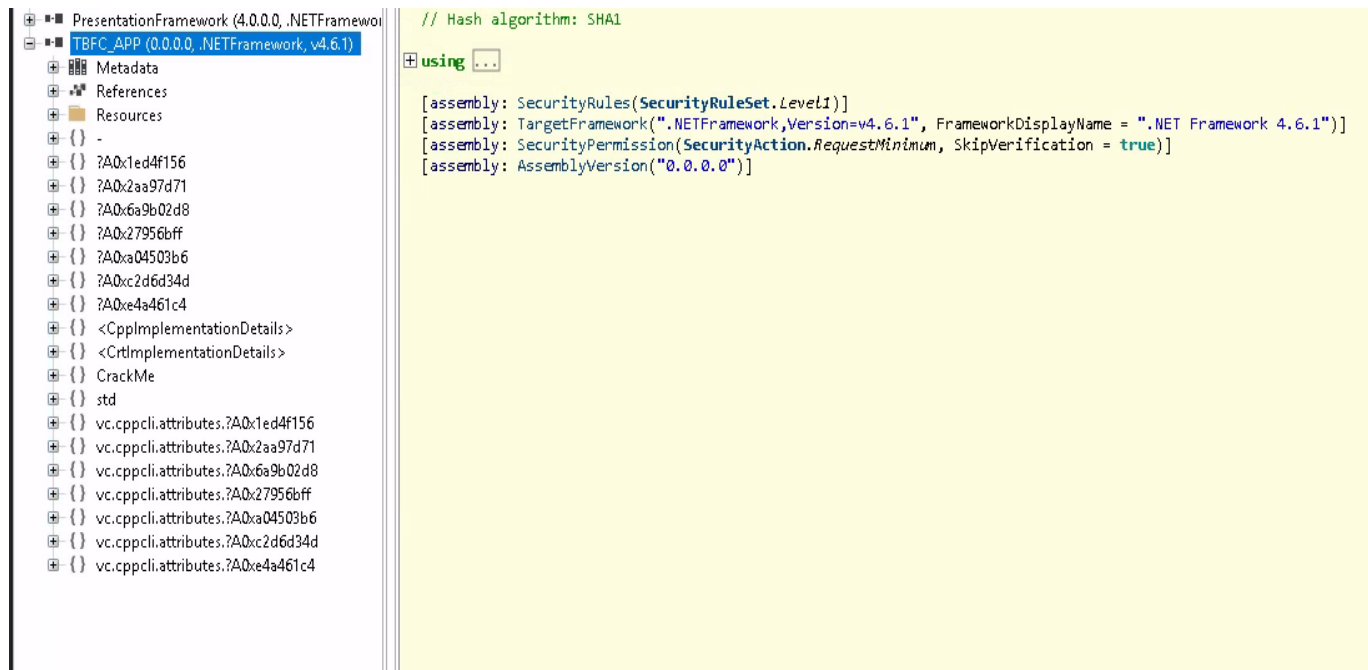

5. As we can see, a message pops up stating that You're not Santa!
6. Now we are gonna use ILSpy to reverse engineer the password

7. Then, open the file that contains the TBFC_APP and begin decompiling

Q: What is Santa's password?

Answer: santapassword321

1. When the decompiling is completed, as we can see there is a tab call CrackMe
2. Look into CrackMe.
3. And there's a MainForm where we can see how the program works.

4. Afterwards, in MainForm there are many objects however the buttonActivate_Click() is what catches our attention.

5. Inside we can see C++ code and how the button works

```
buttonActivate_Click(object sender, EventArgs e)
{
    // CrackMe.MainForm
    using ...

    private unsafe void buttonActivate_Click(object sender, EventArgs e)
    {
        IntPtr value = Marshal.StringToHGlobalAnsi(textBoxKey.Text);
        sbyte* ptr = (sbyte*)System.Runtime.CompilerServices.Unsafe.AsPointer(ref <Module>._?_C@_0BB@IKKDFEPG@santapassword321@);
        void* ptr2 = (void*)value;
        byte b = *(byte*)ptr2;
        byte b2 = 115;
        if ((uint)b >= 115u)
        {
            while ((uint)b <= (uint)b2)
            {
                if (b != 0)
                {
                    ptr2 = (byte*)ptr2 + 1;
                    ptr++;
                    b = *(byte*)ptr2;
                    b2 = (byte)(*ptr);
                    if ((uint)b < (uint)b2)
                    {
                        break;
                    }
                    continue;
                }
            }
            MessageBox.Show("Welcome, Santa, here's your flag thm{046af}", "That's the right key!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);
            return;
        }
        MessageBox.Show("Uh Oh! That's the wrong key", "You're not Santa!", MessageBoxButtons.OK, MessageBoxIcon.Hand);
    }
}
```

6. There's a string containing the password however we aren't sure if that is the password and not a variable in the program, so we click on it since it's a module.

```
er(ref <Module>._?_C@_0BB@IKKDFEPG@santapassword321@);
```

7. That brought us to a tab where there is hexadecimal code.

```
??_C@_0BB@IKKDFEPG@santapassword321@ : $ArrayType$$$BY0BB@$$CBD
// <Module>
+ using ...

internal static $ArrayType$$$BY0BB@$$CBD ??_C@_0BB@IKKDFEPG@santapassword321@/* Not supported: data(73 61 6E 74 61 70 61 73 73 77 6F 72 64 33 32 31 00) */;
```

8. We can head to cyberchef to decode the hexadecimal code.

To get the password.

Q: Now that you've retrieved this password, try to login...What is the flag?

Answer: thm{046af}

1. After retrieving the password, now we can try submitting it to claim the flag

Thought Process/ Methodology:

We begin by launching Remmina while using the machine's ip address to log in. A prompt was shown and we entered the username and password that was given on THM. When we log in, we see a windows platform that contains several applications on the desktop, and there's an application called TBFC_APP that interests us. Then launching the application, there's a password textbox with the submit button and next to the button there's the full name of the application. We try typing random passwords to see if we can get in, however we are greeted with a message that we are not santa. We couldn't brute force our way in, so

we looked at the ILSpy application on the desktop and launched it to look at the code of the application. After opening up the file with the application on ILSpy, we begin looking around the code and try to find something that stands out. As we poke around, there's a tab called CrackMe with MainForm() that catches our eye with several objects inside of it. We see an object that is named buttonActivate_Click() and we suspect that this object is what happens when the submit button is clicked. Afterwards, there was C++ code and we identified how the code works, then we saw a password string but we aren't sure if it's the password, therefore we clicked to see the source of where it is from. There was hexadecimal code displayed, thus we can decode it using cyberchef and retrieve the password. After retrieving the password, we headed into the application and revealed the flag.

Day 19: The Naughty or Nice List

Solution and walkthrough:

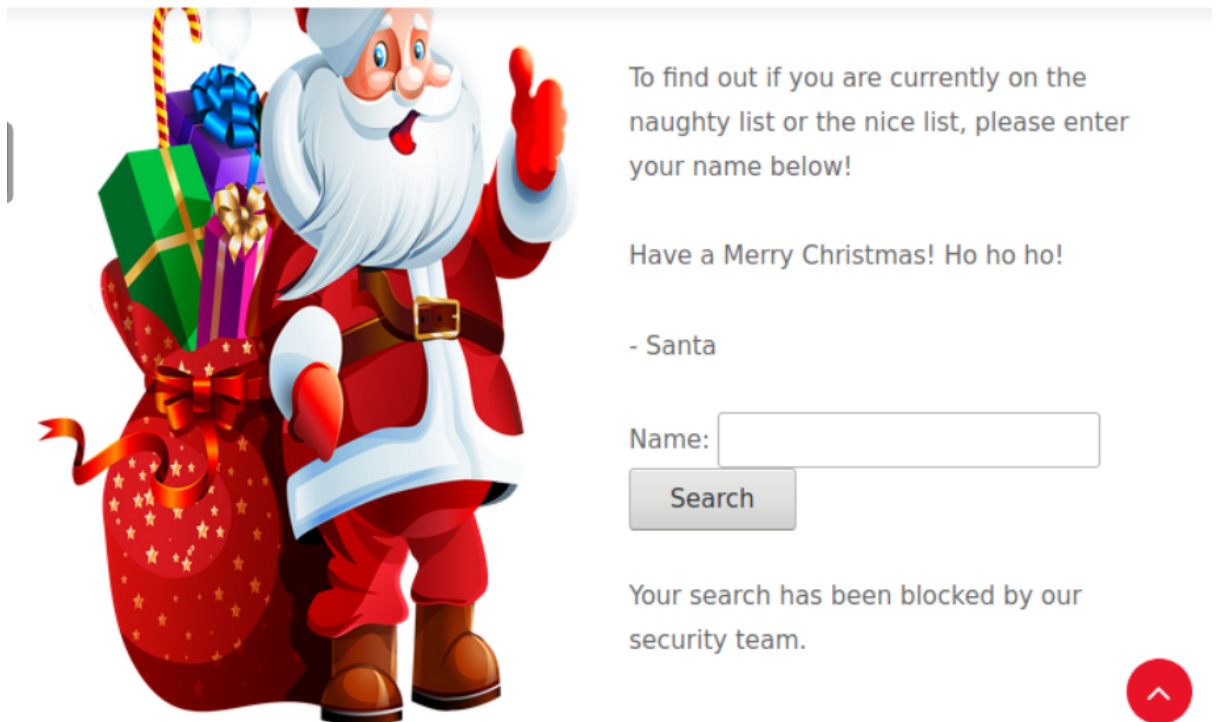

Q1: What is Santa's password?

Answer: Be good for goodness sake!

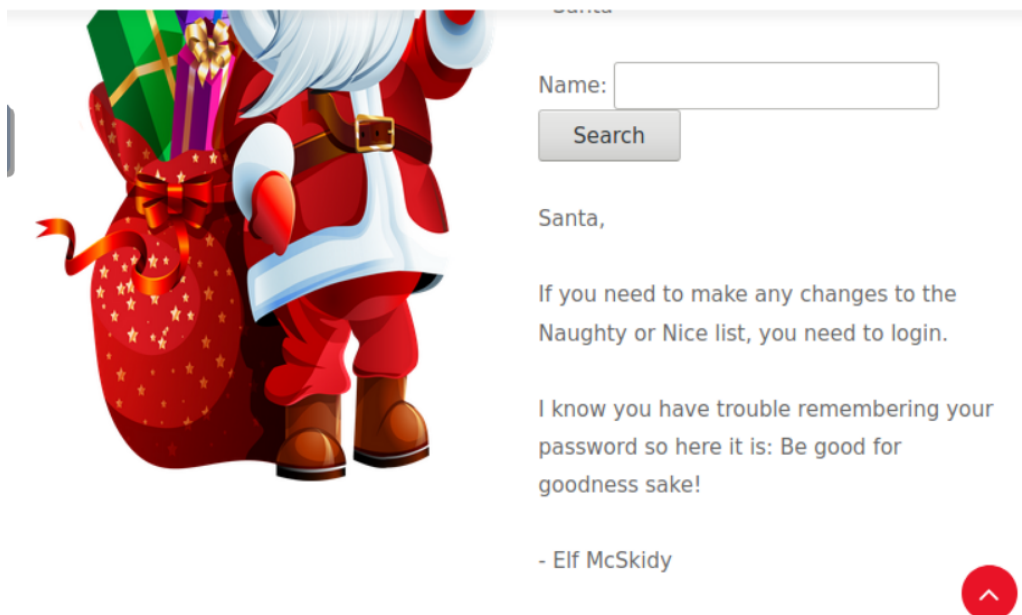

1. We should start by fetching the root of the same site, using the given URL, but we get an error message, "Not Found. The requested URL was not found on this server." This is generic 404 message, which shows we were able to make the server request our modified URL.
2. Next we try changing the port number, to which the message now changes to "Failed to connect to list.hohoho port 80: Connection refused"
3. Since both of those did not work, we try changing the port to 22, which is the default SSH port.

4. The message now changes to "Recv failure: Connection reset by peer". This means port 22 did open but did not understand what was sent.
5. We can also try replacing the list.hohoho hostname with "localhost" or "127.0.0.1", but that causes our search to be blocked.

6. This is because the developer has a check in place for this, which immediately blocks any hostname that does not start with list.hohoho.
7. Therefore, we just use a hostname which does start with list.hohoho, and in this case we use "list.hohoho.localtest.me", to try and bypass that check.

8. Success! It does work. Through this, we have recovered santa's username since it is in Elf McSkidy's message.

Q2: What is the challenge flag?

Answer: THM{EVERYONE_GETS_PRESENTS}

1. Since we have santa's password, all we need is the username, which shouldn't be hard to guess. It is Santa's account, and hence his username is Santa.
2. We log in with Santa's account details, and this screen shows up.

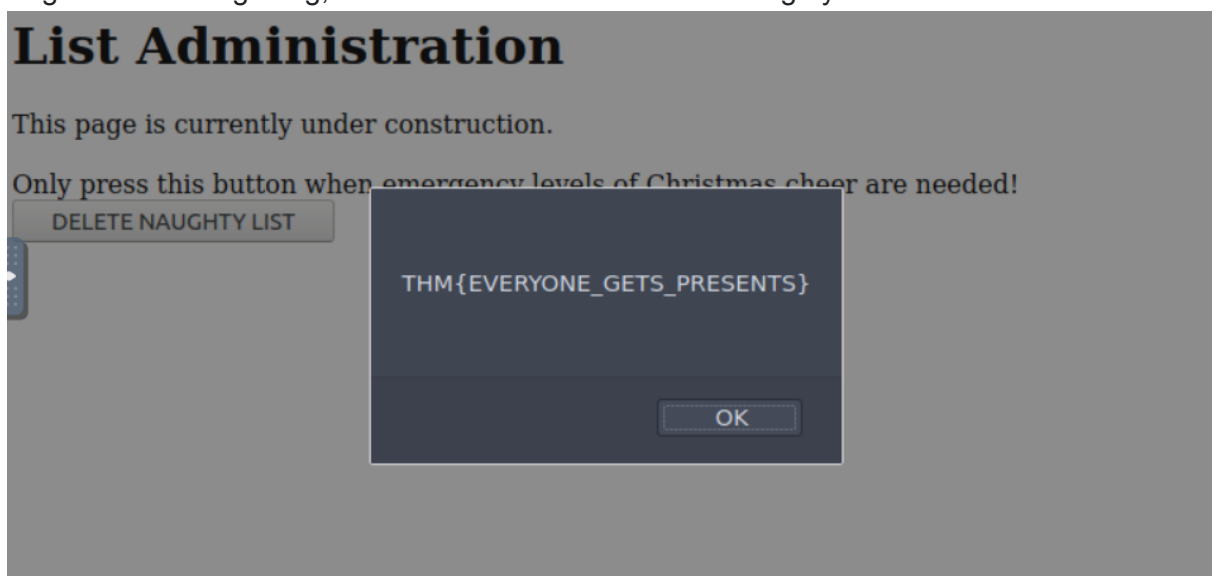

List Administration

This page is currently under construction.

Only press this button when emergency levels of Christmas cheer are needed!

DELETE NAUGHTY LIST

3. To get the challenge flag, all we have to do is delete the naughty list.

4. And voila! There it is, the answer for our question.

Day 20: Powershell to the rescue

Solution and Walkthrough :

Q1: Search for the first hidden elf file within the Documents folder. Read the contents of this file. What does Elf 1 want?

Answer: 2 front teeth

1. Navigate to our Documents directory with the command Set-Location .\Documents\.
The first question asks us to find the contents of the hidden file within this directory.
We can use ls to do this and add the flag -Hidden. The final command is ls -Hidden and will give us the following result.

```
PS C:\Users\mceager\Documents> ls -Hidden

Directory: C:\Users\mceager\Documents

Mode                LastWriteTime         Length Name
----                -
d--hsl             12/7/2020  10:28 AM              My Music
d--hsl             12/7/2020  10:28 AM              My Pictures
d--hsl             12/7/2020  10:28 AM              My Videos
-a-hs-             12/7/2020  10:29 AM            402 desktop.ini
-arh-              11/18/2020   5:05 PM             35 elfone.txt
```

2. Inside there is a hidden file called e1fone.txt. When we read the contents of the file with Get-Content -Path .\e1fone.txt, we see it contains a message about 2 front teeth.

```
PS C:\Users\mceager\Documents> Get-Content .\e1fone.txt
All I want is my '2 front teeth'!!!
PS C:\Users\mceager\Documents>
```

Q: Search on the desktop for a hidden folder that contains the file for Elf 2. Read the contents of this file. What is the name of that movie that Elf 2 wants?

Answer: Scrooged

1. Search for the hidden directory on using ls -Hidden again. We see a hidden directory named elf2wo.

```
PS C:\Users\mceager\Desktop> ls -Hidden

Directory: C:\Users\mceager\Desktop

Mode                LastWriteTime         Length Name
----                -
d--h--             12/7/2020  11:26 AM              elf2wo
-a-hs-             12/7/2020  10:29 AM            282 desktop.ini

PS C:\Users\mceager\Desktop>
```

2. When we search the contents of this directory we see a file called e70smsW10Y4k.txt. When we read the contents of this file with Get-Content it reveals the movie Scrooged.

```
PS C:\Users\mceager\Desktop> cd .\elf2wo\  
PS C:\Users\mceager\Desktop\elf2wo> ls -Hidden  
PS C:\Users\mceager\Desktop\elf2wo> ls  
  
Directory: C:\Users\mceager\Desktop\elf2wo  
  
Mode                LastWriteTime         Length Name  
----                -  
-a----            11/17/2020 10:26 AM             64 e70smsW10Y4k.txt  
  
PS C:\Users\mceager\Desktop\elf2wo> Get-Content e70smsW10Y4k.txt  
I want the movie Scrooged <3!  
PS C:\Users\mceager\Desktop\elf2wo> █
```

Q: Search the Windows directory for a hidden folder that contains files for Elf 3. What is the name of the hidden folder? (This command will take a while)

Answer: 3lfthr3e

1. Search the entire Windows directory for a hidden directory containing the third file. We can do this with the command Get-ChildItem -Path / -Recurse -Hidden -ErrorAction SilentlyContinue. After scrolling through the output, we see a hidden directory within System32 called 3lfthr3e.

```
Directory: C:\Windows\System32  
  
Mode                LastWriteTime         Length Name  
----                -  
d--h--            11/23/2020  3:26 PM             3lfthr3e  
d--h--            11/23/2020  2:26 PM             GroupPolicy
```

Q: How many words does the first file contain?

Answer: 9999

1. Use the command Get-Content C:\Windows\System32\3lfthr3e\1.txt | Measure-Object -Word and see that the file has 9999 words.

```
PS C:\Users\mceager\Desktop\elf2wo> Get-Content C:\Windows\System32\3lfthr3e\1.txt | Measure-Object -Word  
Lines Words Characters Property  
-----  
9999  
  
PS C:\Users\mceager\Desktop\elf2wo> █
```

Q: What 2 words are at index 551 and 6991 in the first file?

Answer: Red Ryder

1. After finding the total number of words, we want to find specific words in the file. We can do this with the command (Get-Content C:\Windows\System32\3lfthr3e\1.txt)[index] where the index is the location of the word we want to find. We can use this to find 551 and 6991 respectively.

```
PS C:\Users\mceager\Desktop\elf2wo> (Get-Content C:\Windows\System32\3lfthr3e\1.txt)[551]
Red
PS C:\Users\mceager\Desktop\elf2wo> (Get-Content C:\Windows\System32\3lfthr3e\1.txt)[6991]
Ryder
PS C:\Users\mceager\Desktop\elf2wo> █
```

Q: This is only half the answer. Search in the 2nd file for the phrase from the previous question to get the full answer. What does Elf 3 want? (use spaces when submitting the answer)

Answer: Red Ryder BB Gun

1. Finally, we want to search the second file for the phrase from the previous question. We can do this with the command Select-String -Path C:\Windows\System32\3lfthr3e\2.txt -Pattern 'redryder'.

```
PS C:\Users\mceager\Desktop\elf2wo> Select-String -Path C:\Windows\System32\3lfthr3e\2.txt -Pattern 'redryder'
C:\Windows\System32\3lfthr3e\2.txt:558704:redryderbbgun
PS C:\Users\mceager\Desktop\elf2wo> █
```
